Know the "difference"...

ULTRA VAN A New and Different Concept in Motorhomes

CONSTRUCTION

The conventional motorhome uses a heavy truck chassis and a wood framed body which contributes little to the overall strength of the vehicle. The ULTRA VAN uses true monocoque construction utilizing high strength, lightweight aluminum alloys and aircraft fabrication techniques. As in the fuselage design of an airplane, the ULTRA VAN body and chassis are one integral unit resulting in an exceptionally strong yet lightweight vehicle.

CONFIGURATION

The unique side-mounted, midship engine provides outstanding balance, handling and stability for the ULTRA VAN while allowing for exceptional space utilization.

ECONOMY

ULTRA VAN's lightweight aerodynamic design provides impressive savings on gasoline—up to 13 miles per gallon, twice that of most motorhomes.
